## SOLAR ATTENUATING GLASS

The solar attenuating glass windshield filters sunlight passing through a special laminated layer.

Electronic actuating cards, such as toll road payment cards or Radio Frequency (RF) ID tags, can be fixed at the dedicated locations. The locations are on the inside of the windshield. If the cards are located at any other part of a solar attenuating windshield, the electronic scanners may not recognise them.

The optimal fixing location is at the top of the windshield, as shown at (1), close to the interior rear-view mirror.
